Bad Design

The reason this interface is bad is because it overwhelms the user. The majority of the time, a student is going on Zagweb to view their student profile, which is now much lower on the page, and much smaller than other options. The Student Profile page is much smaller than other options such as "Zagcard & Bulldog Bucks", which takes up an entire section.

Resource Links:

[Student Profile page](#)
[Housing and Residence Life](#)
[National Student Clearinghouse](#)
[Scholarship Impact Form](#)
[Student Athletes](#)
[Student COVID Notice](#)

Another reason this interface is bad is because the spaces in links are not underlined. This makes it seem as if "Student", "Profile" and "page" are separate links the user can click.

Good Design

This light switch is an example of good design because it fixes the problems plagued by other types of multi-controlled light switches. Whereas other designs use an "up-down" way to toggle

the light switch, this design uses a single button press. This button press has an LED light that signifies the current state of the light, fixing one issue with lights that have multiple switches.

Augmented Design

This is an augmented design because someone added a label to the phone that informs the user on what the number of the phone is.
